

TECHNOTRACK

GENERAL INFORMATION

A new addition to the Technowrap product line, TechnoTrack is an internet hosted repair register system which is used to form part of a business's maintenance management system (MMS). It enables maintenance personnel to review the condition, functionality and operability of asset inventory, such as pressure containment defects and repairs as well as superstructure and fitting repairs. The TechnoTrack application can be customised and has the ability to store information variables unique to your MMS requirements. These features help to integrate the system into a company's procedures and make it easier for staff to become familiar with the new technology.

TechnoTrack is compatible with the latest Maintenance Management Systems and is designed to comply with the recognised Safety Critical Elements (SCE) identified within your overall Asset Integrity Management System (AIMS).

THE BENEFITS

After an extensive two year study of currently used repair registers it became evident that there was no set standard to which these registers conformed to. Most contained the basic information required to register and identify a repair but did not have any built-in intelligence to flag-up life time expiry. Additionally, a repairs documentation history was not always easily or readily available for inspection when external audits were being undertaken. This created delays and time consuming searches to obtain the repairs required Quality Assured traceability. The Technotrack system will automatically flag when repairs are nearing the end of their

design life and enable operators to pre-plan a re-design, replacement or change out of the repair. The system will also link to the historical documentation of a repair should an external audit request its trace history.

FEATURES

- Real time repair register/ maintenance reporting
- Flags repair expiries enabling critical system forecasting
- Instant process, area, date range and shut down procedures through systems search engine
- Efficient repair analysis
- Historical repair milestone tracking
- Standardised register format
- Data security
- Priority user data input & control
- Links all available repair documentation
- Seamless technology updates available
